

Black holes dynamics: some ideas for the discussion

Mario Spera (mario.spera@oapd.inaf.it) (mario.spera@live.it)

Postdoctoral fellow at Astronomical Observatory of Padova (FIRB2012, Co-PI: [Michela Mapelli](#))

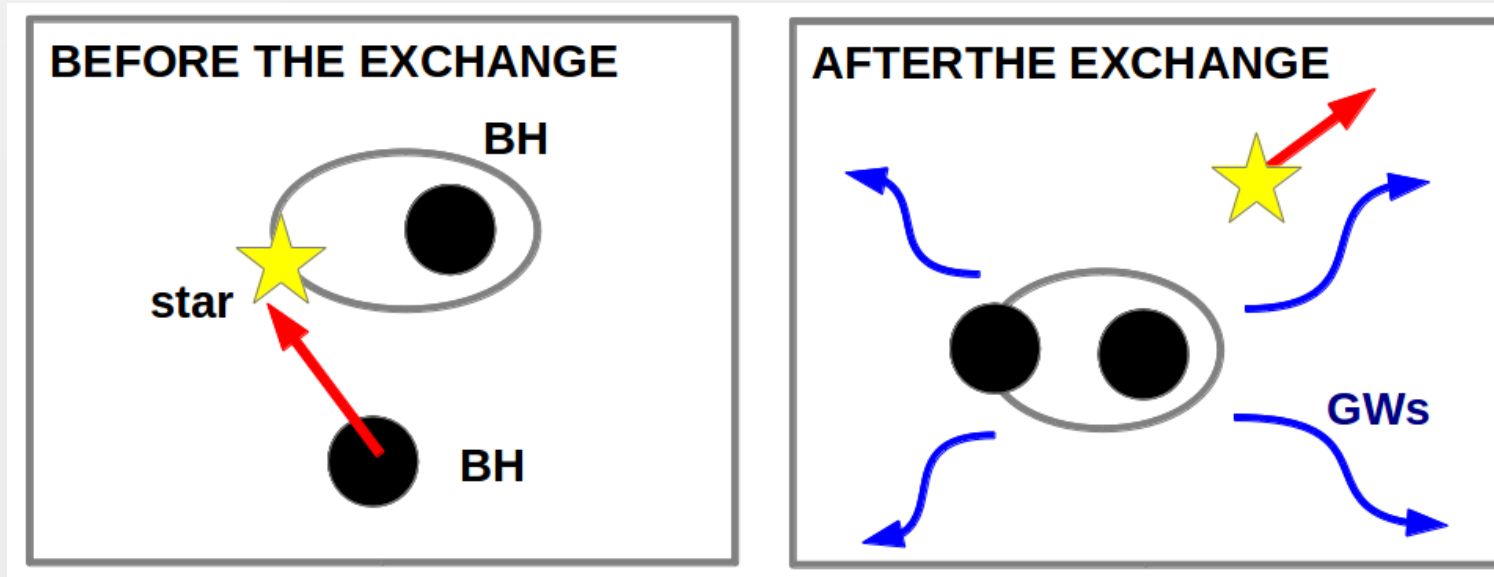

Rome, April 11th 2016

DYNAMICAL or PRIMORDIAL origin?

How can we put constraints?

From **Michela's talk**: dynamics produces **more massive** binaries
and with **larger eccentricity** (Ziosi+ 2014)

Is this always true?

DYNAMICAL or PRIMORDIAL origin?

How can we put constraints?

Issues to be addressed

Uncertainties in dynamical processes: Spitzer instability

Realistic initial conditions of star cluster simulations (gas, primordial binary fraction, ...)

Statistics of simulations

Supernova explosion models (mass, kicks, ...)

Binary stellar evolution (common envelope phase)

SPITZER INSTABILITY

(Spitzer 1969)

MASS SEGREGATION

EJECTION

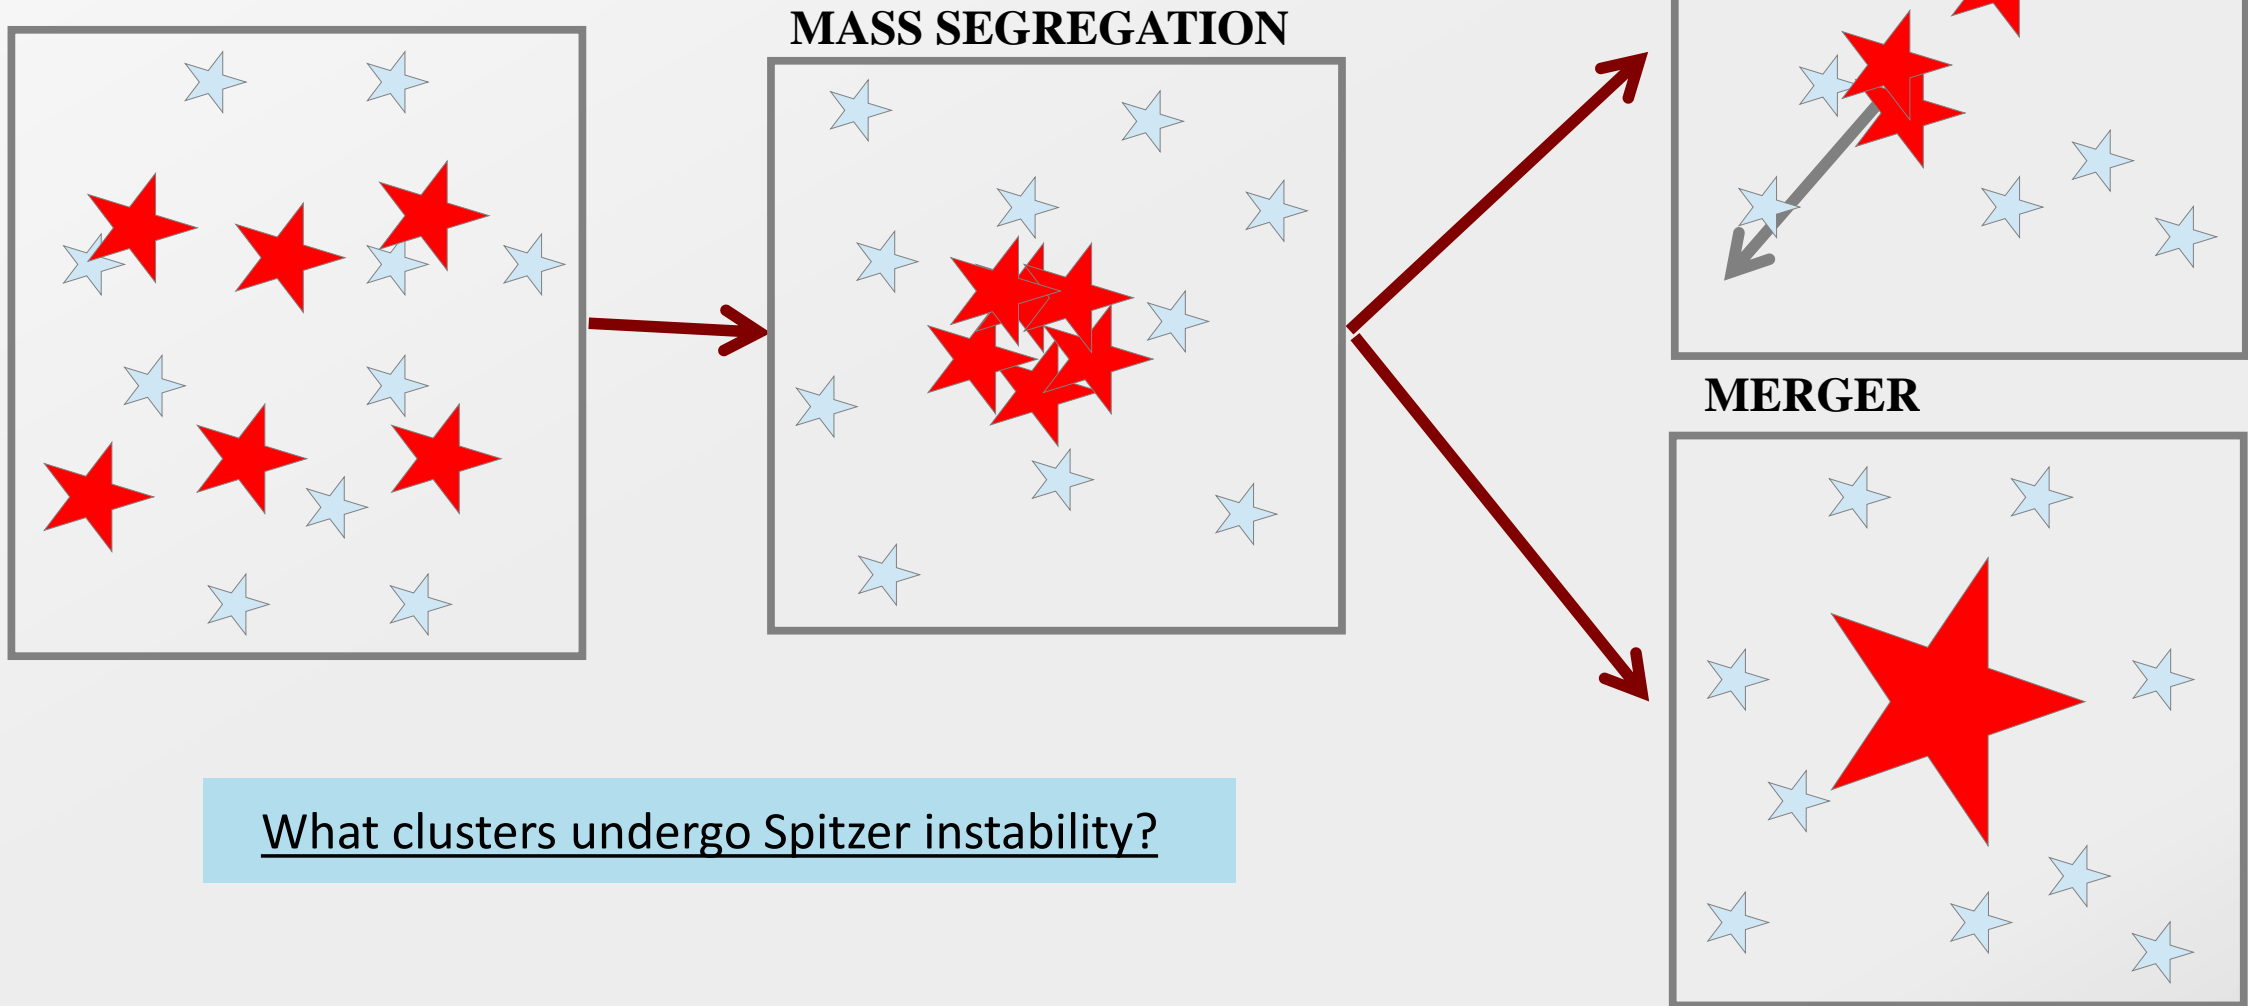

MERGER

SPITZER INSTABILITY

(Spitzer 1969)

What clusters undergo Spitzer instability?

DYNAMICAL or PRIMORDIAL origin?

How can we put constraints?

Issues to be addressed

Uncertainties in dynamical processes: Spitzer instability

Realistic **initial conditions** of star cluster simulations
(gas, primordial binary fraction, ...)

Statistics of simulations

Supernova explosion models (mass, kicks, ...)

Binary stellar evolution (common envelope phase)

Initial conditions of star clusters

DYNAMICAL or PRIMORDIAL origin?

What is the preferred environment for mergers of dynamically formed binaries?

Old clusters, young clusters, the field?

Issues

- ✓ Young clusters dissolve in the field: what happens to their binaries?
- ✓ Binaries can be ejected dynamically in the field (e.g. Spitzer instability) – how many binaries?
- ✓ What can we get from simulations + EM follow-up about the environment?

Ejections from a star cluster

@ 100 Myr

80 – 90 % NSs are ejected

40 % BHs are ejected

Spitzer instability in star clusters

Merger rates
